## Normalization (Conts)

# Boyce-Codd Normal Form (BCNF)

- ❑ A given relation is called in Boyce-Codd Normal Form (BCNF) if and only if
  - ✓ Relation already exists in 3NF.
  - ✓ For each non-trivial functional dependency  $A \rightarrow B$ ,  $A$  is a super key of the relation.

# Boyce-Codd Normal Form (BCNF)

- ❑ Example: The following relation is in BCNF:
- ❑  $R(A, B, C)$       FD:  $\{A \rightarrow B, B \rightarrow C, C \rightarrow A\}$
- ❑ Find candidate key =?
  - So, Candidate keys are A , B , C.
- ❑ Now, we can observe that LHS of each given functional dependency is a candidate key.
- ❑ Thus, we conclude that the given relation is in BCNF.

# Boyce-Codd Normal Form (BCNF)

- ❑ Example: The following relation is not in BCNF:
- ❑  $R(ABC)$ , FD:  $\{AB \rightarrow C, C \rightarrow B\}$
- ❑ Find candidate key =?
  - So, Candidate key is = AB, AC
- ❑ Now, we can observe that LHS of each given functional dependency.
- ❑ In  $AB \rightarrow C$ , AB is a candidate key but  $C \rightarrow B$ , C is not a candidate key.
- ❑ So this relation is not in BCNF.

# Boyce-Codd Normal Form (BCNF)

- ❑ Example: How to decompose this relation into BCNF?
- ❑ If a given functional dependency LHS is not a candidate key,
- ❑ we remove the given functional dependency from the relation by placing them in a new relation (Create a new table for each functional dependency which is not in BCNF).
- ❑  $R(ABC)$ , FD:  $\{AB \rightarrow C, C \rightarrow B\}$  will be,
  - $R_1(\underline{ABC})$ , FD:  $\{AB \rightarrow C\}$  here AB is candidate key
  - $R_2(\underline{CB})$ , FD:  $\{C \rightarrow B\}$  here C is candidate key

# Boyce-Codd Normal Form (BCNF)

□  $R(ABC)$ , FD:  $\{AB \rightarrow C, C \rightarrow B\}$  will be,

➤  $R_1(\underline{ABC})$ , FD:  $\{AB \rightarrow C\}$  here AB is candidate key

➤  $R_2(\underline{CB})$ , FD:  $\{C \rightarrow B\}$  here C is candidate key

A	B	C
A	1	X
B	2	Y
C	2	Z
C	3	W
D	3	W
C	3	W

A	B	C
A	1	X
B	2	Y
C	2	Z
C	3	W
D	3	W
C	3	W

B	C
1	X
2	Y
2	Z
3	W

# 1NF, 2NF, 3NF, BCNF

- Steps to find a relation in which normal form:
  - First Check a relation is in **BCNF** or **not**?
  - If it is not in BCNF then, Check it is in **3NF** or **not**?
  - If it is not in 3NF then, Check it is in **2NF** or **not**?
  - If it is not in 2NF then, it is **definitely** in 1NF.

# Find the Normal Forms

- ❑ Example:  $R(ABCDEFGH)$ , FD's:  $\{AB \rightarrow C, A \rightarrow DE, B \rightarrow F, F \rightarrow GH\}$
- ❑ Candidate key: AB, Prime attributes: A, B and Non- prime attributes: C, D, E, F, G, H
- ❑ First step, check given relation is in BCNF or not?
  - Check LSH of all FD's: Is it a super key or not?
  - In  $AB \rightarrow C$ , LSH is a super key.
  - But, in  $\{A \rightarrow DE, B \rightarrow F, F \rightarrow GH\}$  LSH is not a super key.
  - So, the relation is not in BCNF. (If an FD fails, the whole relationship fails.)

If the relation is not in BCNF, then check given relation is in 3NF or not?

# Find the Normal Forms

- ❑ Example:  $R(ABCDEFGH)$ , FD's:  $\{AB \rightarrow C, A \rightarrow DE, B \rightarrow F, F \rightarrow GH\}$
- ❑ Candidate key: AB, Prime attributes: A, B and Non- prime attributes: C, D, E, F, G, H
- ❑ Second step, If the relation is not in BCNF, then check given relation is in 3NF or not?
  - Check all FD's: either LHS is a super key or RHS is a prime attributes?
  - In  $AB \rightarrow C$ , LSH is a super key.
  - In  $\{A \rightarrow DE, B \rightarrow F, F \rightarrow GH\}$  LSH of every FD's are not a super key or RHS are not a prime attribute.
  - So, the relation is not in 3NF.
  - If the relation is not in 3NF, then check given relation is in 2NF or not?

# Find the Normal Forms

- ❑ Example:  $R(ABCDEFGH)$ , FD's:  $\{AB \rightarrow C, A \rightarrow DE, B \rightarrow F, F \rightarrow GH\}$
- ❑ Candidate key: AB, Prime attributes: A, B and Non- prime attributes: C, D, E, F, G, H
- ❑ Third step, If the relation is not in 3NF, then check given relation is in 2NF or not?
  - Check all FD's: Is there any Prime  $\rightarrow$  Non-prime exist or not? If exist then, it is not in 2NF
  - In  $A \rightarrow DE$ , Prime  $\rightarrow$  Non-prime exist. A is prime attribute and D and E are non-prime attributes. So, the relation is not in 2NF.
  - If the relation is not in 2NF, then check given relation is in 1NF.

# Find the Normal Forms: Exercises

- ❑  $R(ABCDE), \quad \text{FD: } \{CE \rightarrow D, D \rightarrow B, C \rightarrow A\}$
- ❑  $R(ABCDEF), \quad \text{FD: } \{AB \rightarrow C, DC \rightarrow AE, E \rightarrow F\}$
- ❑  $R(ABCDE), \quad \text{FD: } \{AB \rightarrow CD, D \rightarrow A, BC \rightarrow DE\}$
- ❑  $R(ABCDE), \quad \text{FD: } \{BC \rightarrow ADE, D \rightarrow B\}$
- ❑  $R(ABCDEFGHI), \quad \text{FD: } \{AB \rightarrow D, BD \rightarrow B, AD \rightarrow GH, A \rightarrow I\}$
- ❑  $R(VWXYZ), \quad \text{FD: } \{X \rightarrow YV, Y \rightarrow Z, Z \rightarrow Y, VW \rightarrow X\}$
- ❑  $R(ABCDEF), \quad \text{FD: } \{ABC \rightarrow D, ABD \rightarrow E, CD \rightarrow F, CDF \rightarrow B, BF \rightarrow D\}$
- ❑  $R(ABC), \quad \text{FD: } \{A \rightarrow B, B \rightarrow C, C \rightarrow A\}$
